RESIDES, MEMORIES ARE
CREATED, FRIENDS ALWAYS
BELONG, AND LAUGHTER
NEVER ENDS.”**

PROBLEM STATEMENT

FAIR HOUSING IS NOT AN OPTION- IT IS THE LAW. CARL HARRIS

Questions

- 1) For real estate agents: What are the key factors to predict the price of a house?
- 2) For home buyers: What is the most important factor determining the value of a house?
- 3) For home sellers: How can a house's value be increased?

Data: King County Housing Dataset

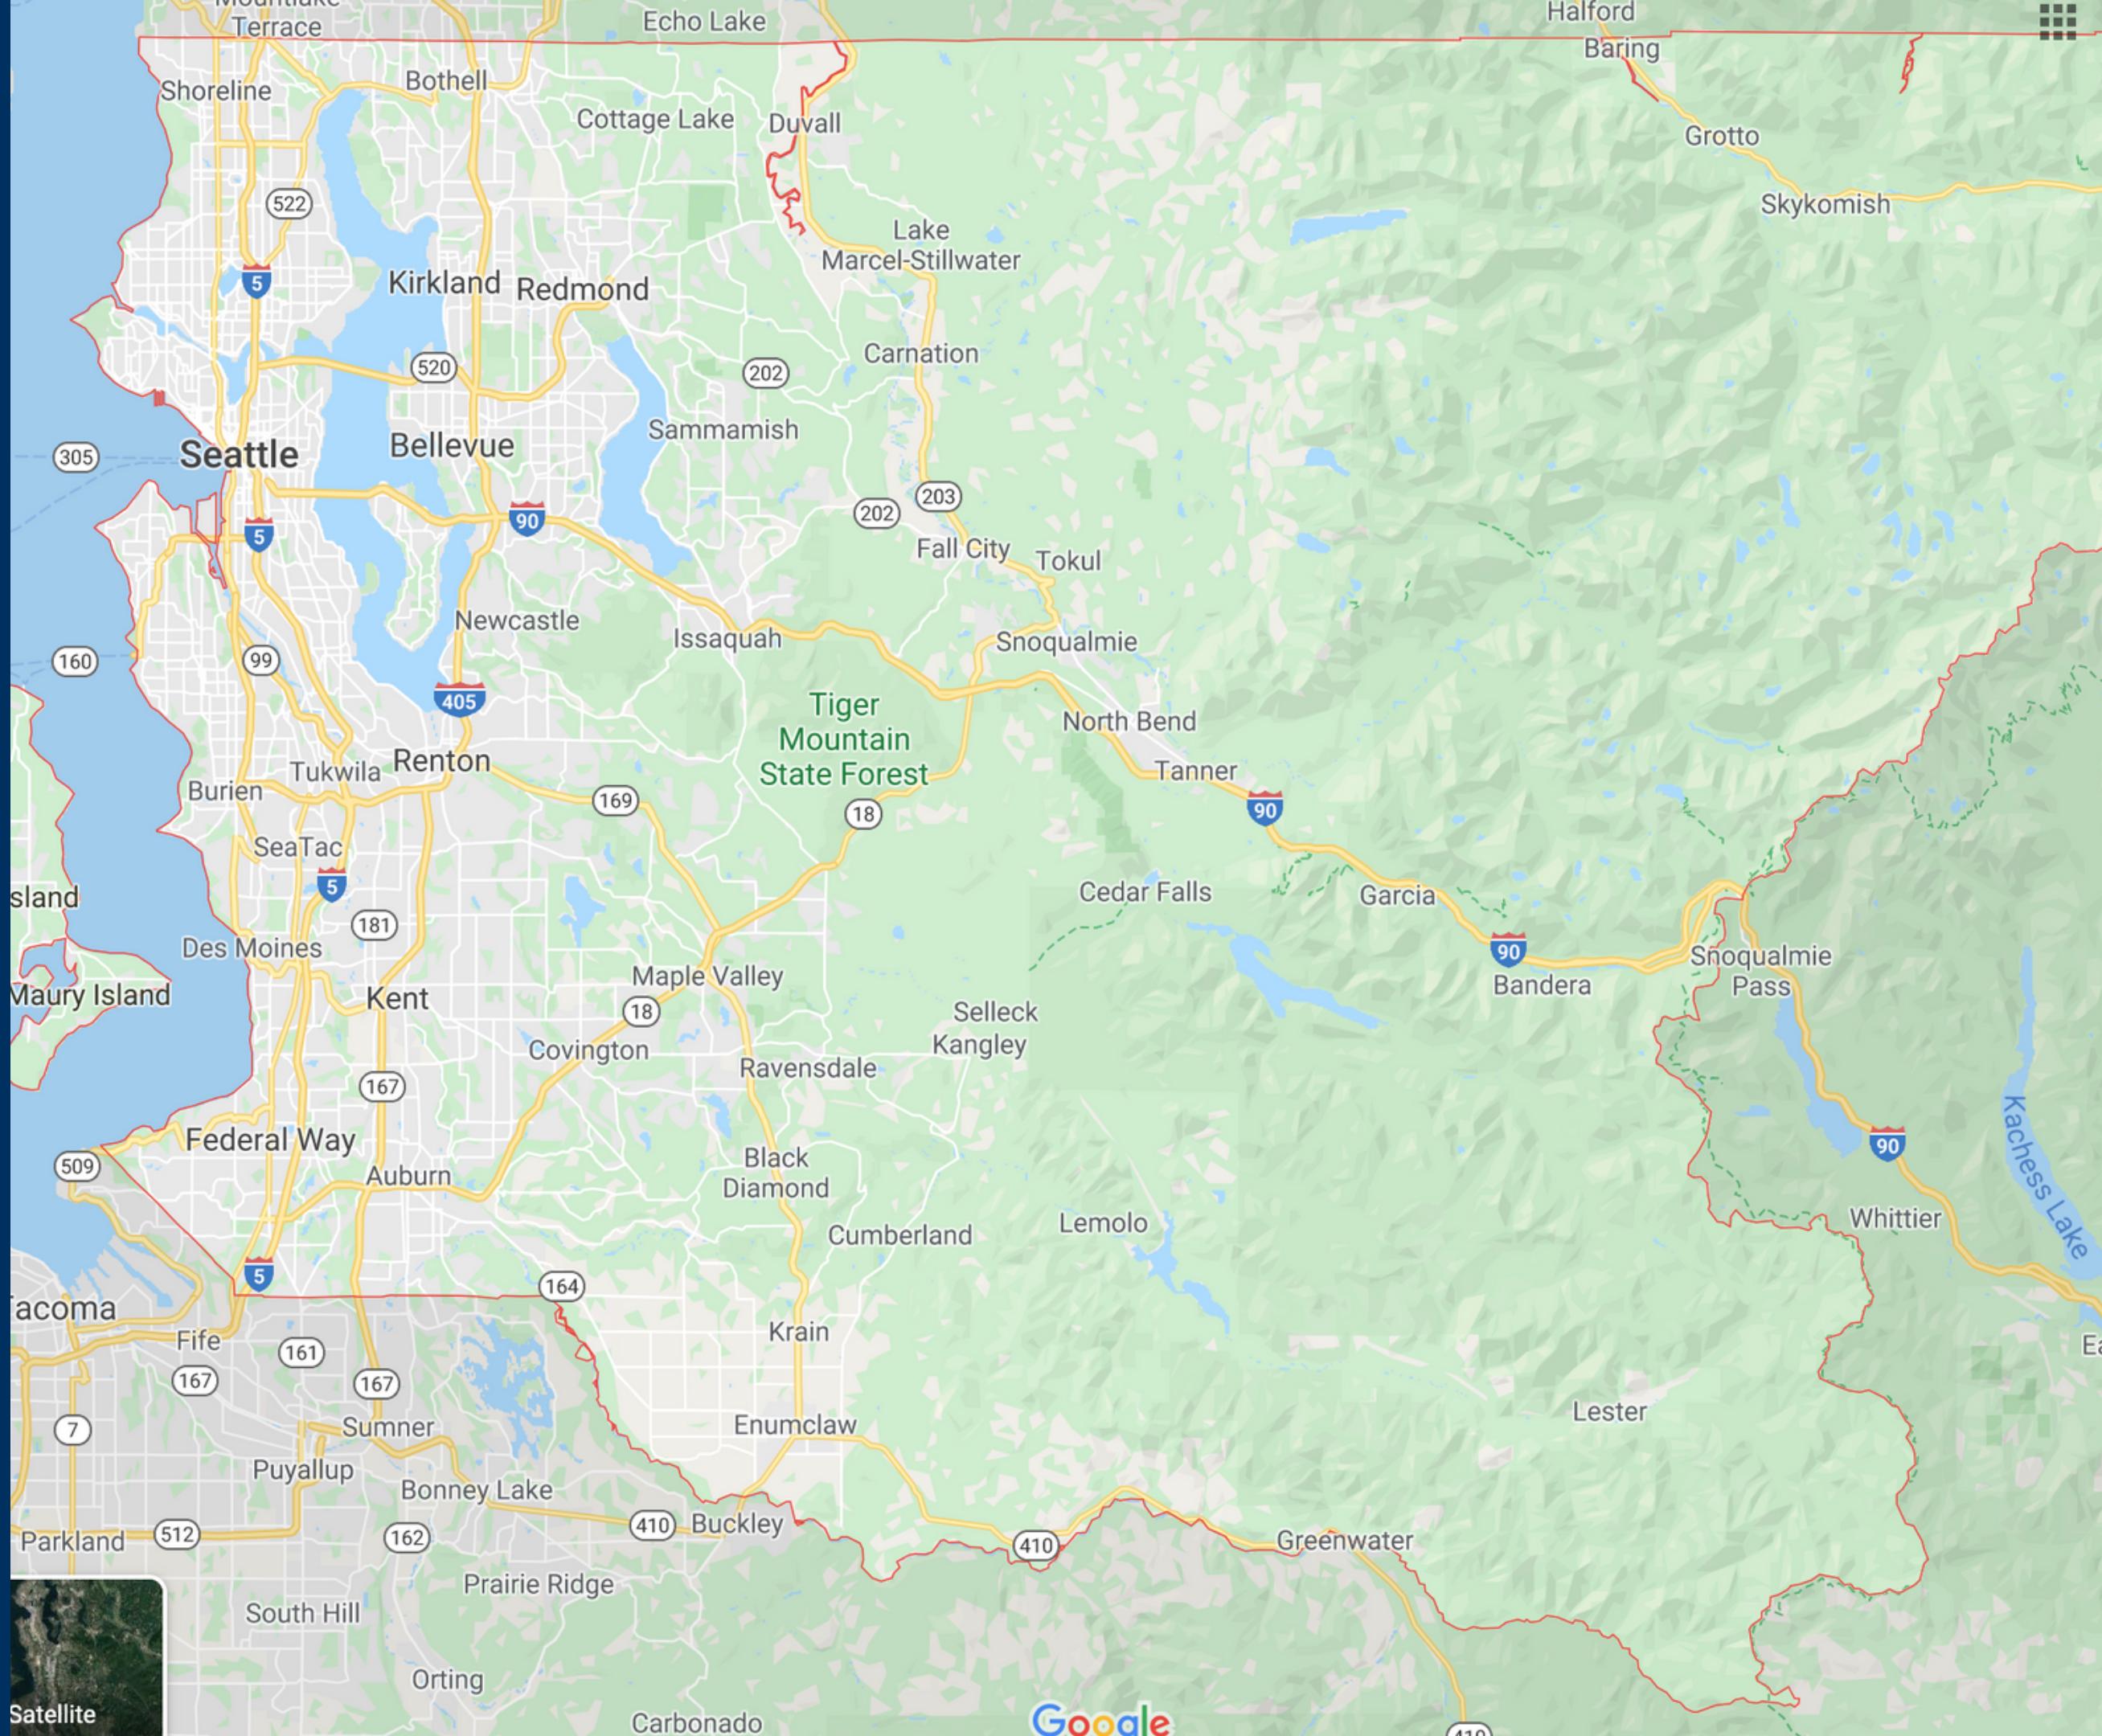

The data is from the King county, Seattle, Washington.

The dataset contains the basic information about 21597 houses sold in 2014 and 2015.

Bedrooms, bathrooms, square footage, location, floors, view, condition are some of the given factors to guess the price.

I first explored the data then made a model. The model was %89 successful, I need more information to predict the price more efficiently.

METHODOLOGY

TO PREDICT THE PRICE OF A HOUSE WITH THE GIVEN FACTORS

METHODOLOGY

KEY FACTORS

The analysis of key factors determining the price of a house.

DATA SCIENCE

Data Science techniques to answer business questions.

ANSWER QUESTIONS

A question of each group; Home buyers, home sellers and real estate agents.

VISUALIZATIONS

The result is explained by visualisations and maps.

PARAMETERS IN THE MODEL

LOCATION

SQUARE FOOTAGE OF THE HOUSE
(BASEMENT, LOT AND LIVING AREA)

NUMBER OF BATHROOMS

NUMBER OF BEDROOMS

GRADE OF THE CONSTRUCTION QUALITY

CONDITION OF RENOVATIONS

THE MONTH HOUSE WAS SOLD

VIEW OF THE HOUSE

RECOMMENDATIONS

FOR BUYERS, SELLERS AND REAL ESTATE AGENTS

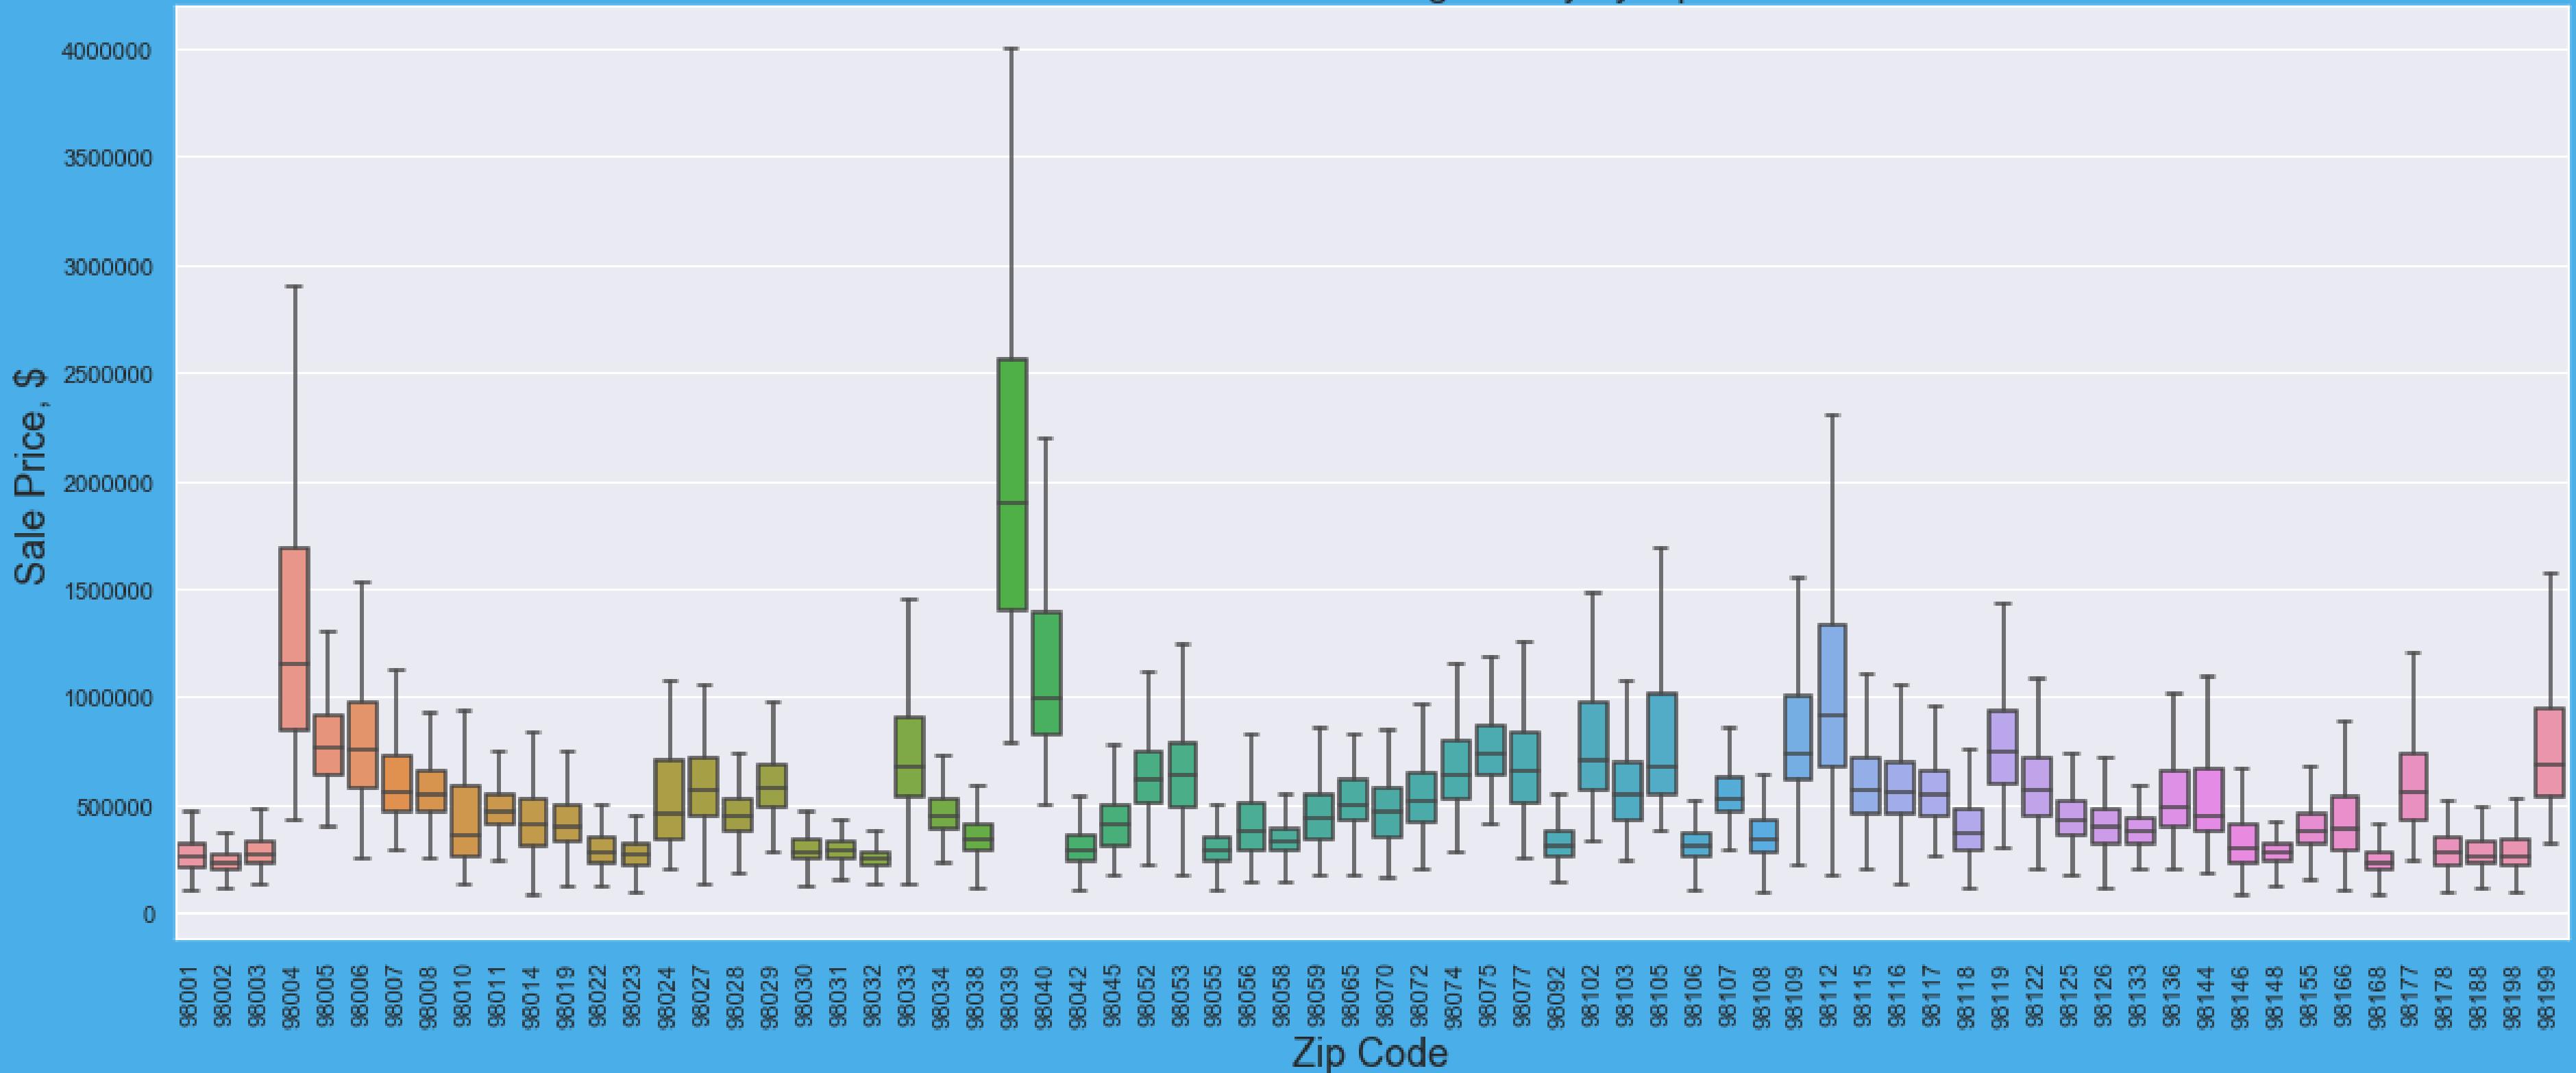

Recommendations

1) For home buyers;

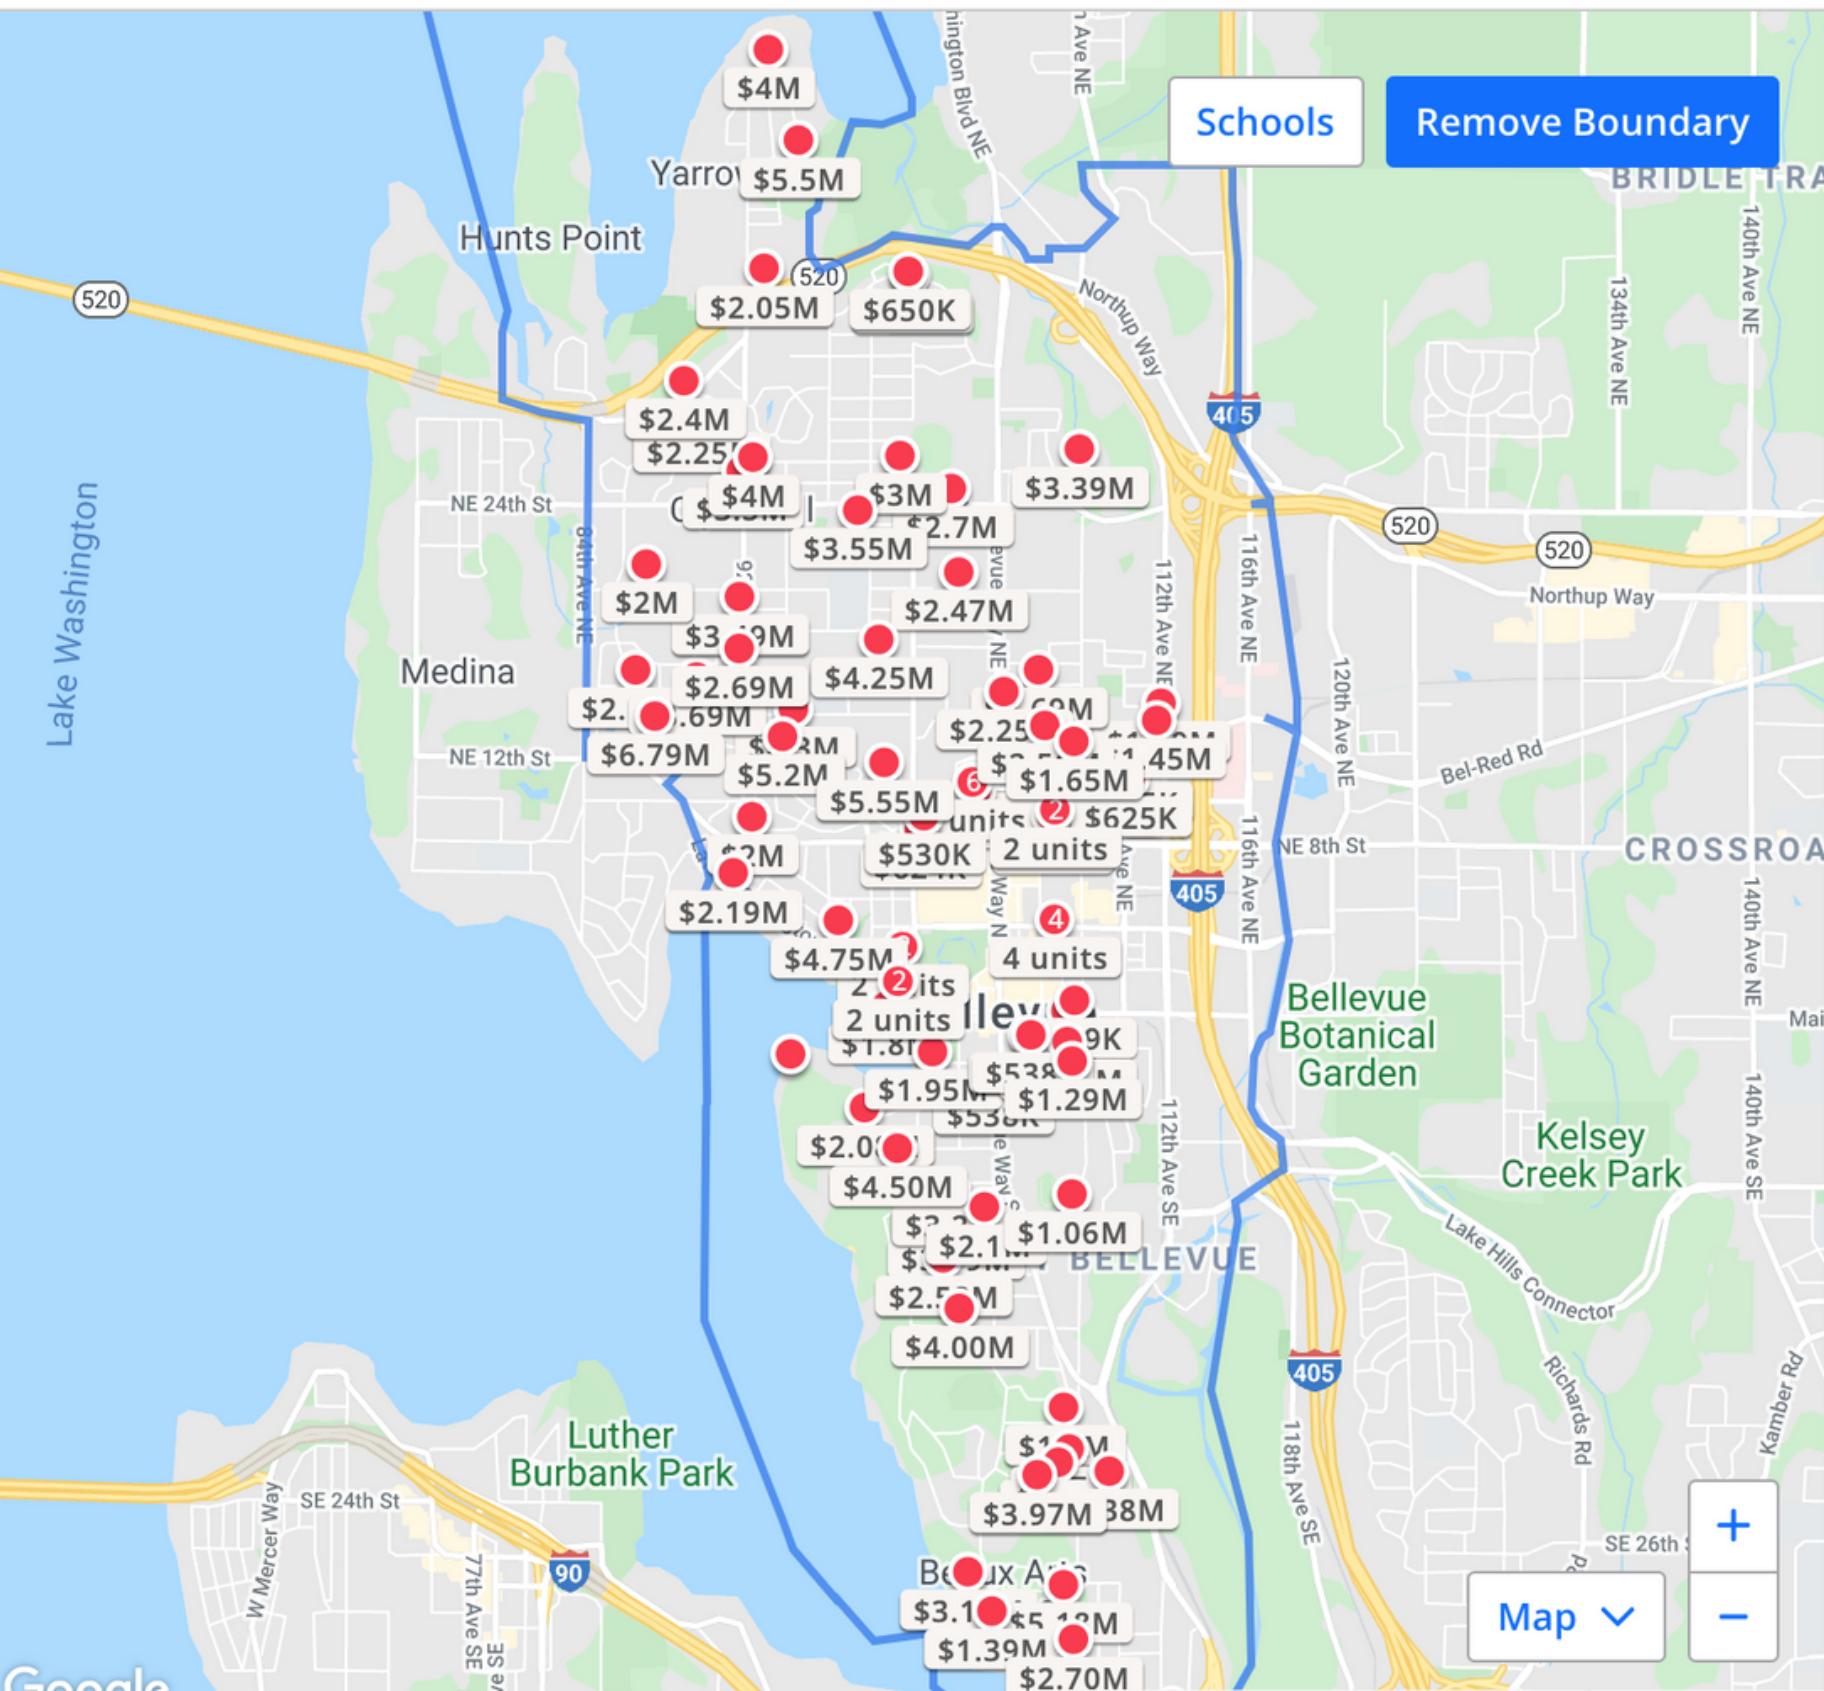

The most important factor determining the value of a house is LOCATION! Because you can do many renovations and upgrades in a house but you can not change the location of it. A good view or waterfront may double the house's price.

Second important factor you can change very difficult is square footage of living area. More rooms mean more value if the location is correct.

PRICE VS. LATITUDE SCATTER REGRESSION PLOT

We can make two inferences from this graph:

- i) North of the city is more expensive than the South.
- ii) More houses are sold in the North.

There can be two reasons for this:

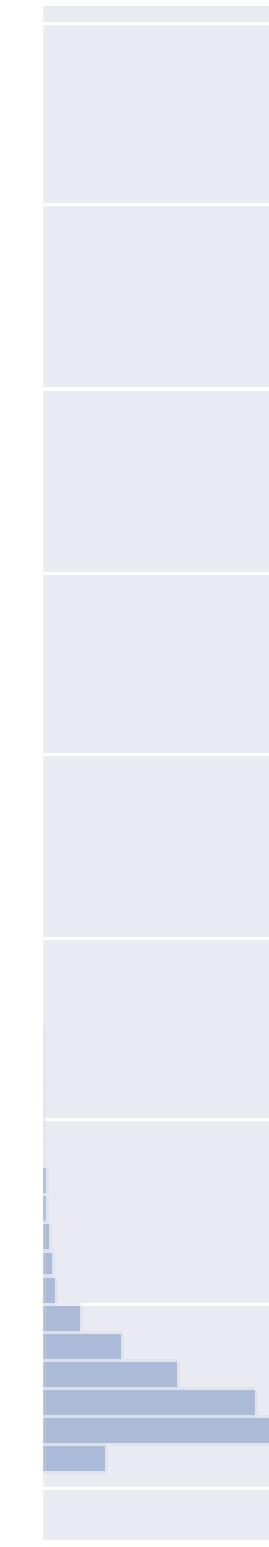

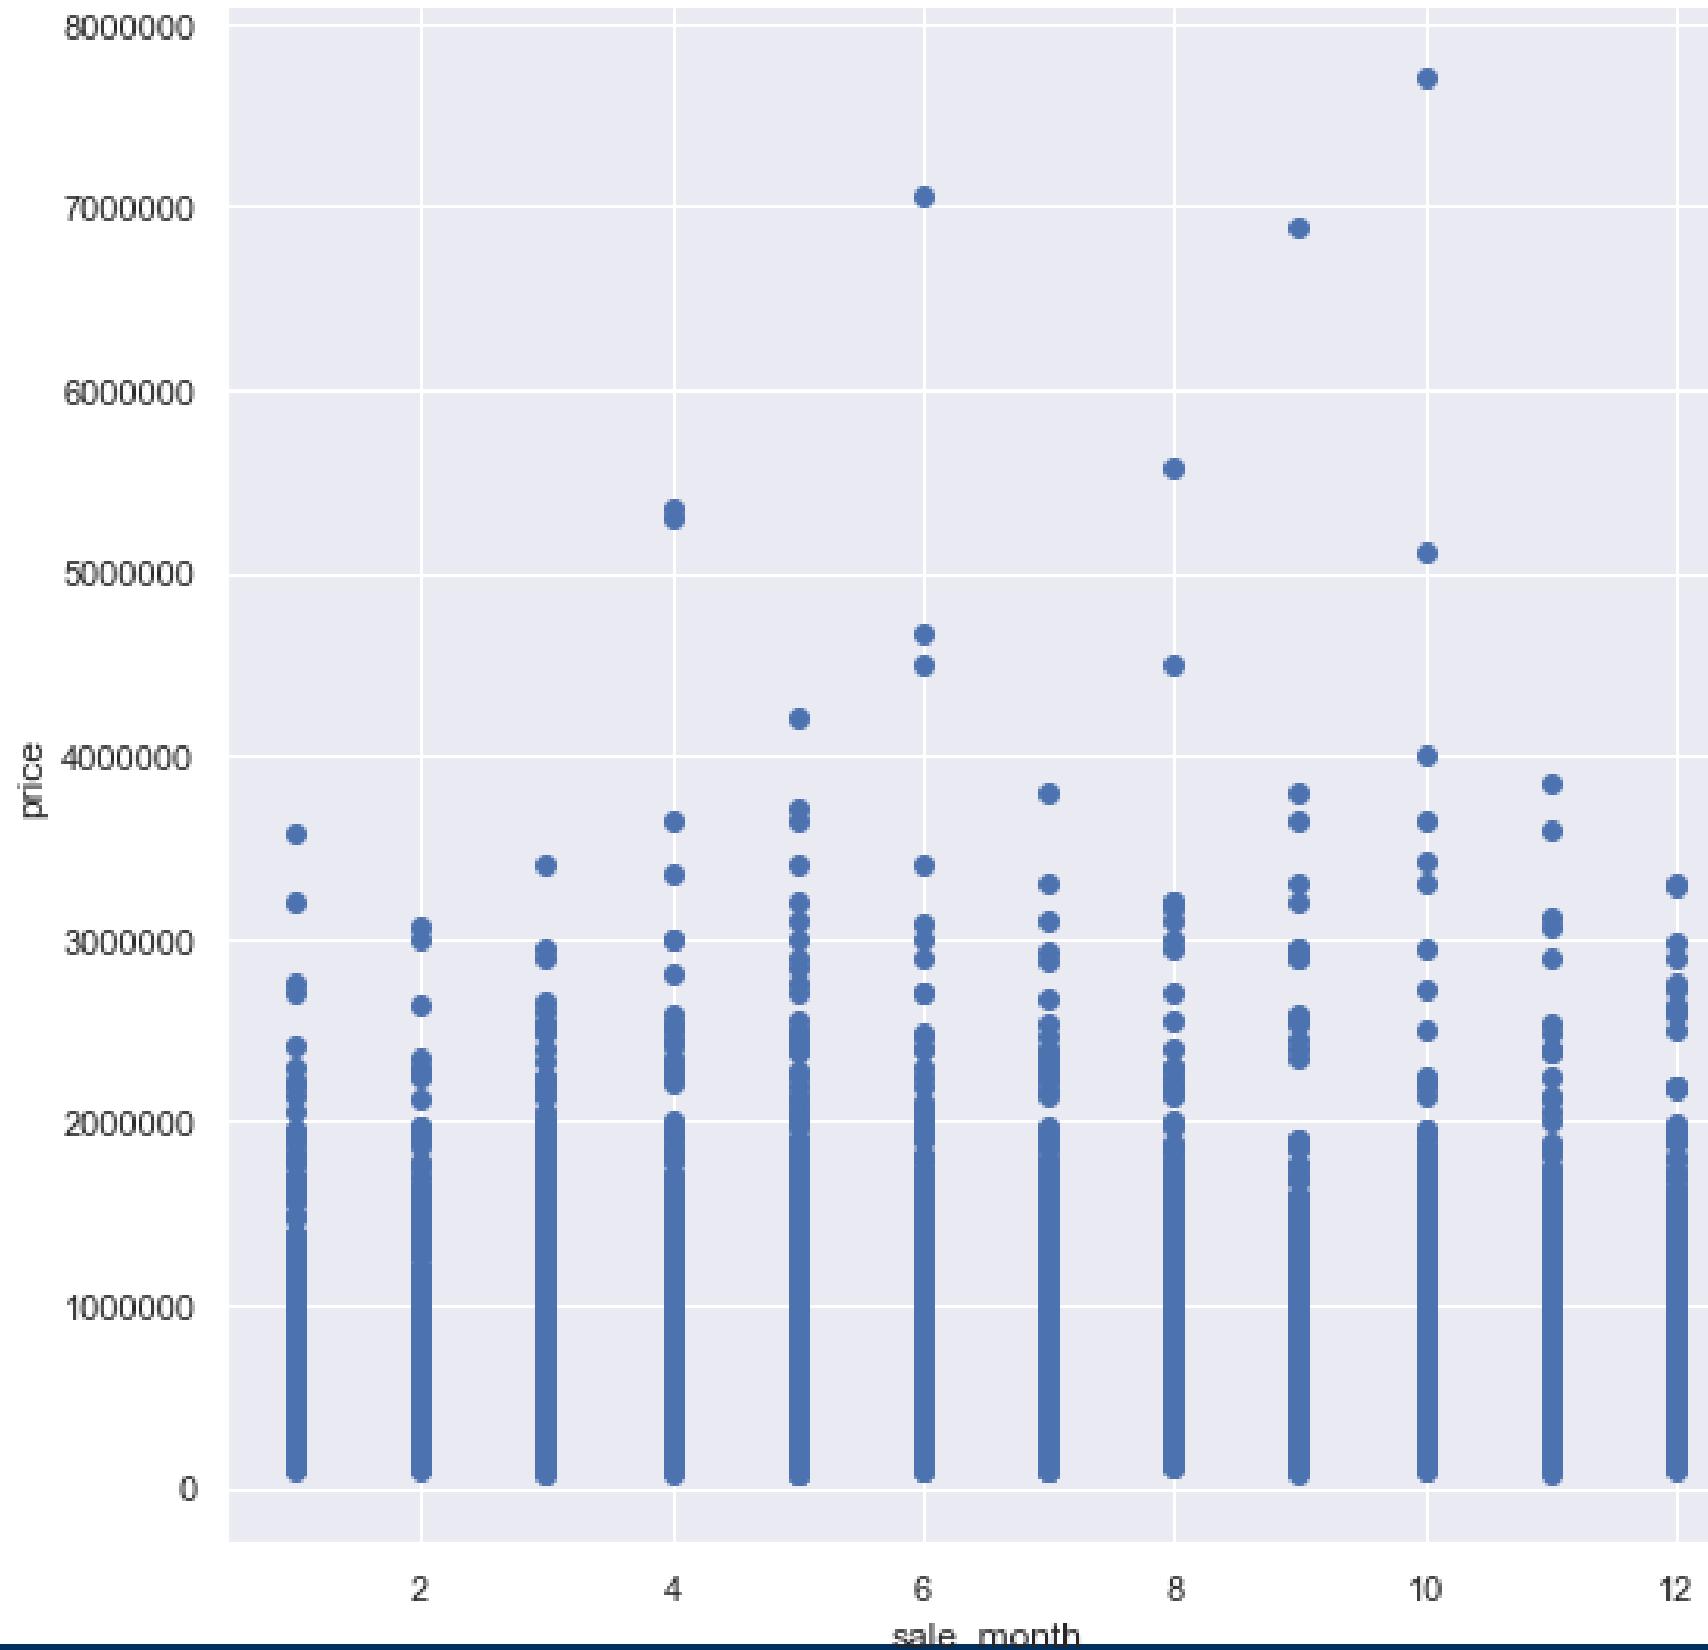

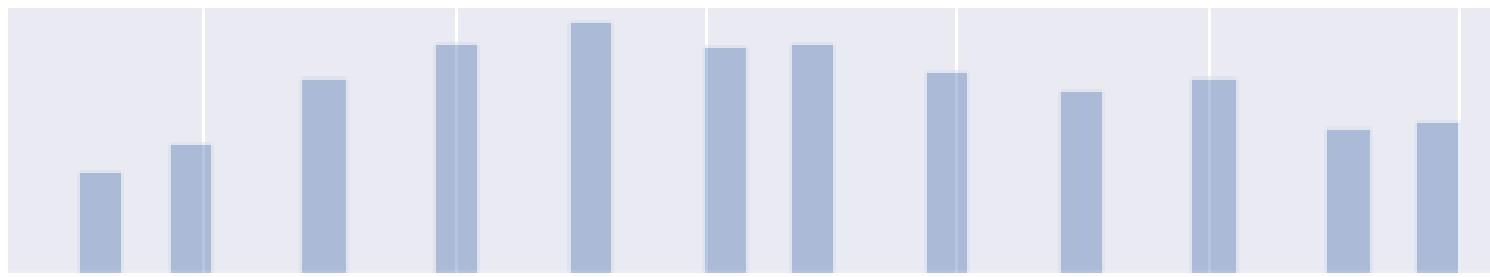

- 1) There are more houses in the North and/or
- 2) There is a growing housing market in the North. The city is expanding to the North.

A close-up photograph of an architectural blueprint showing floor plans and elevation details. A claw hammer with a blue handle lies diagonally across the top left corner of the blueprint, symbolizing construction or renovation.

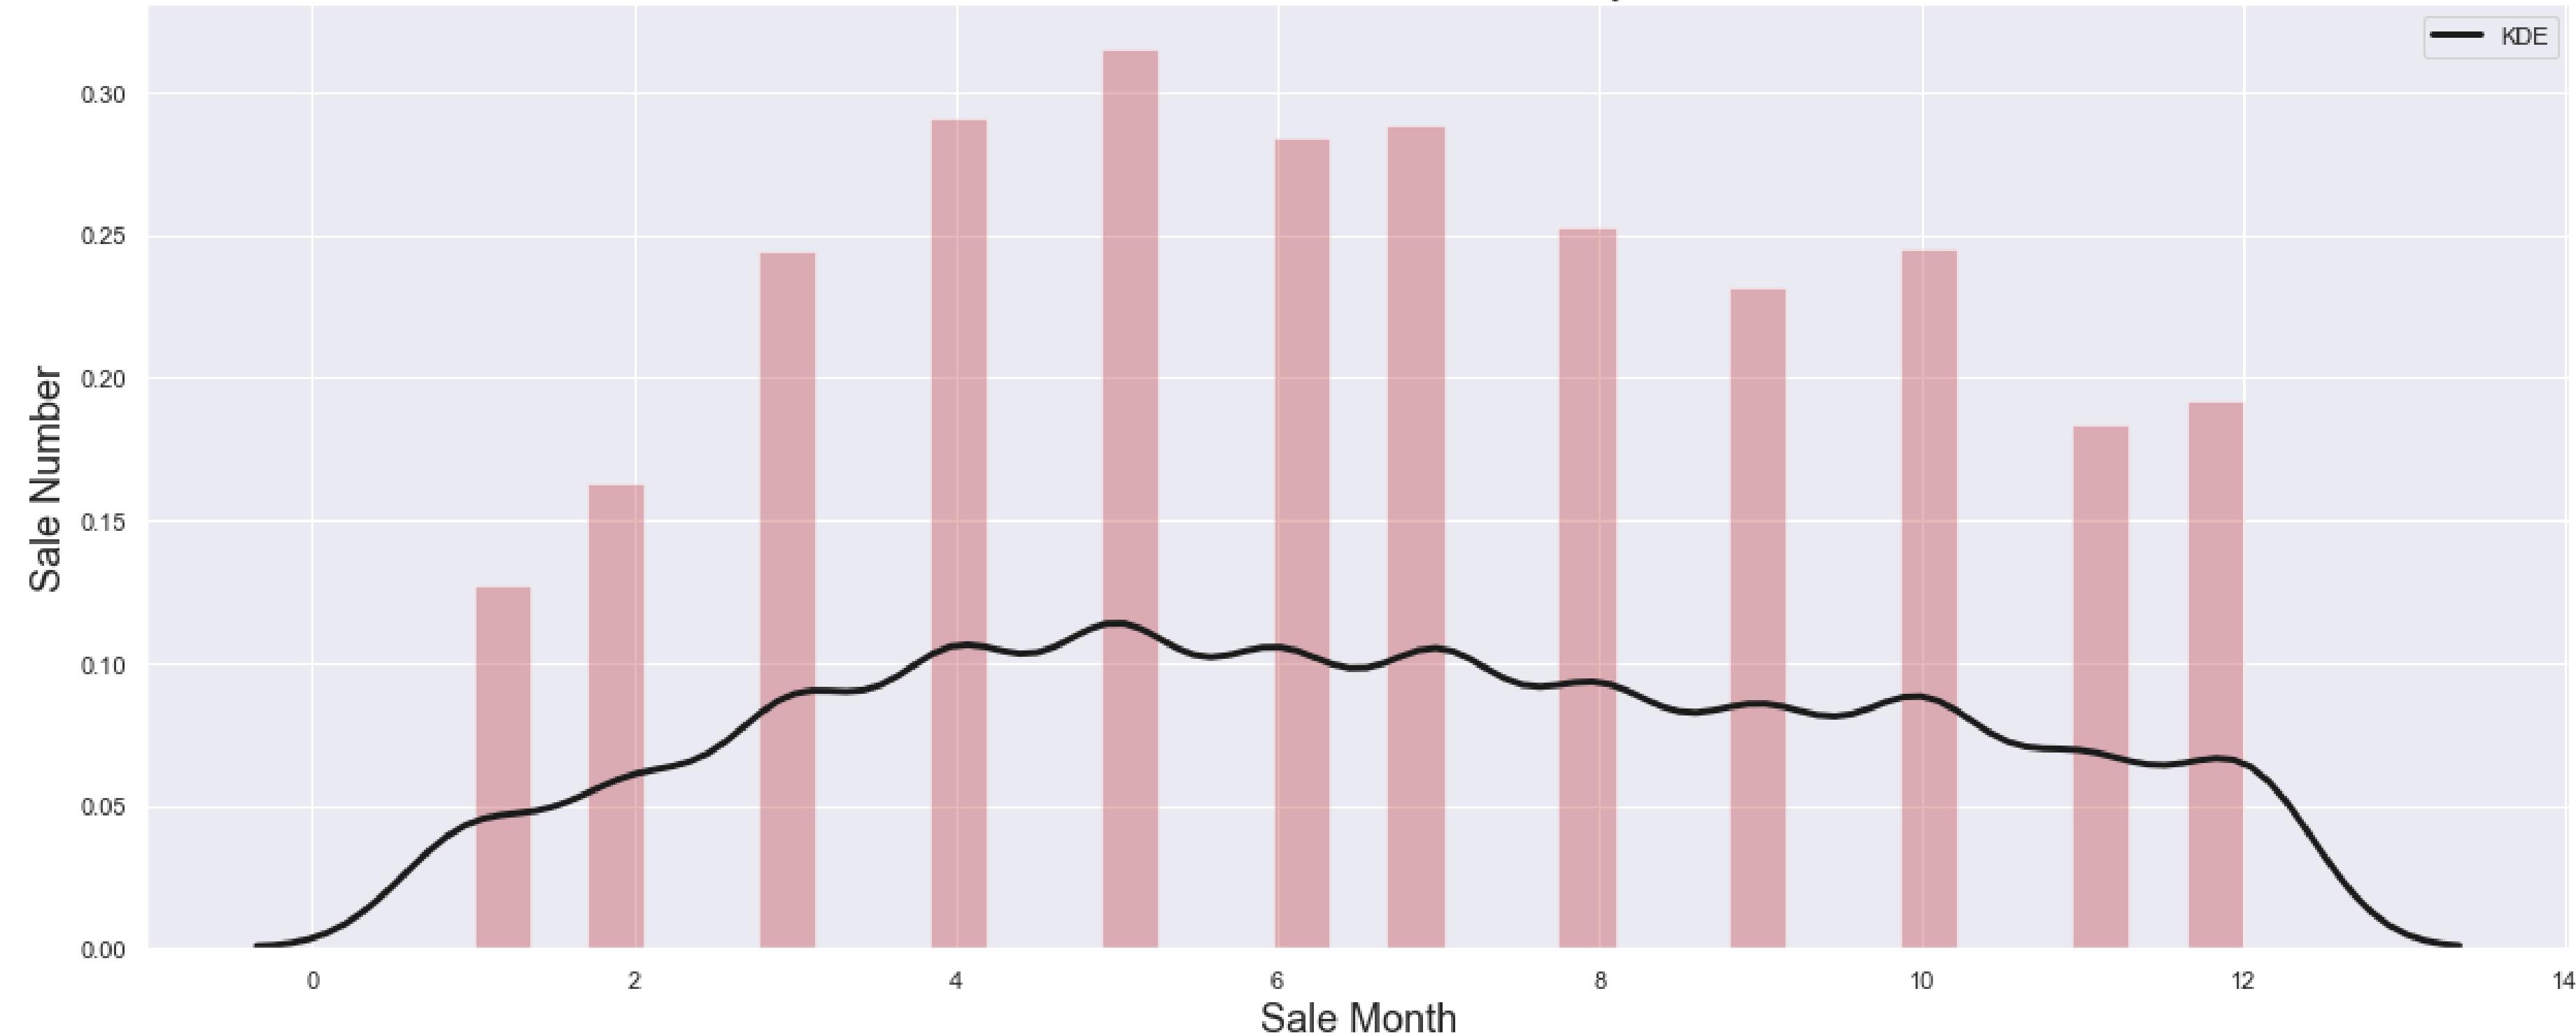

Recommendations

2) For home sellers;

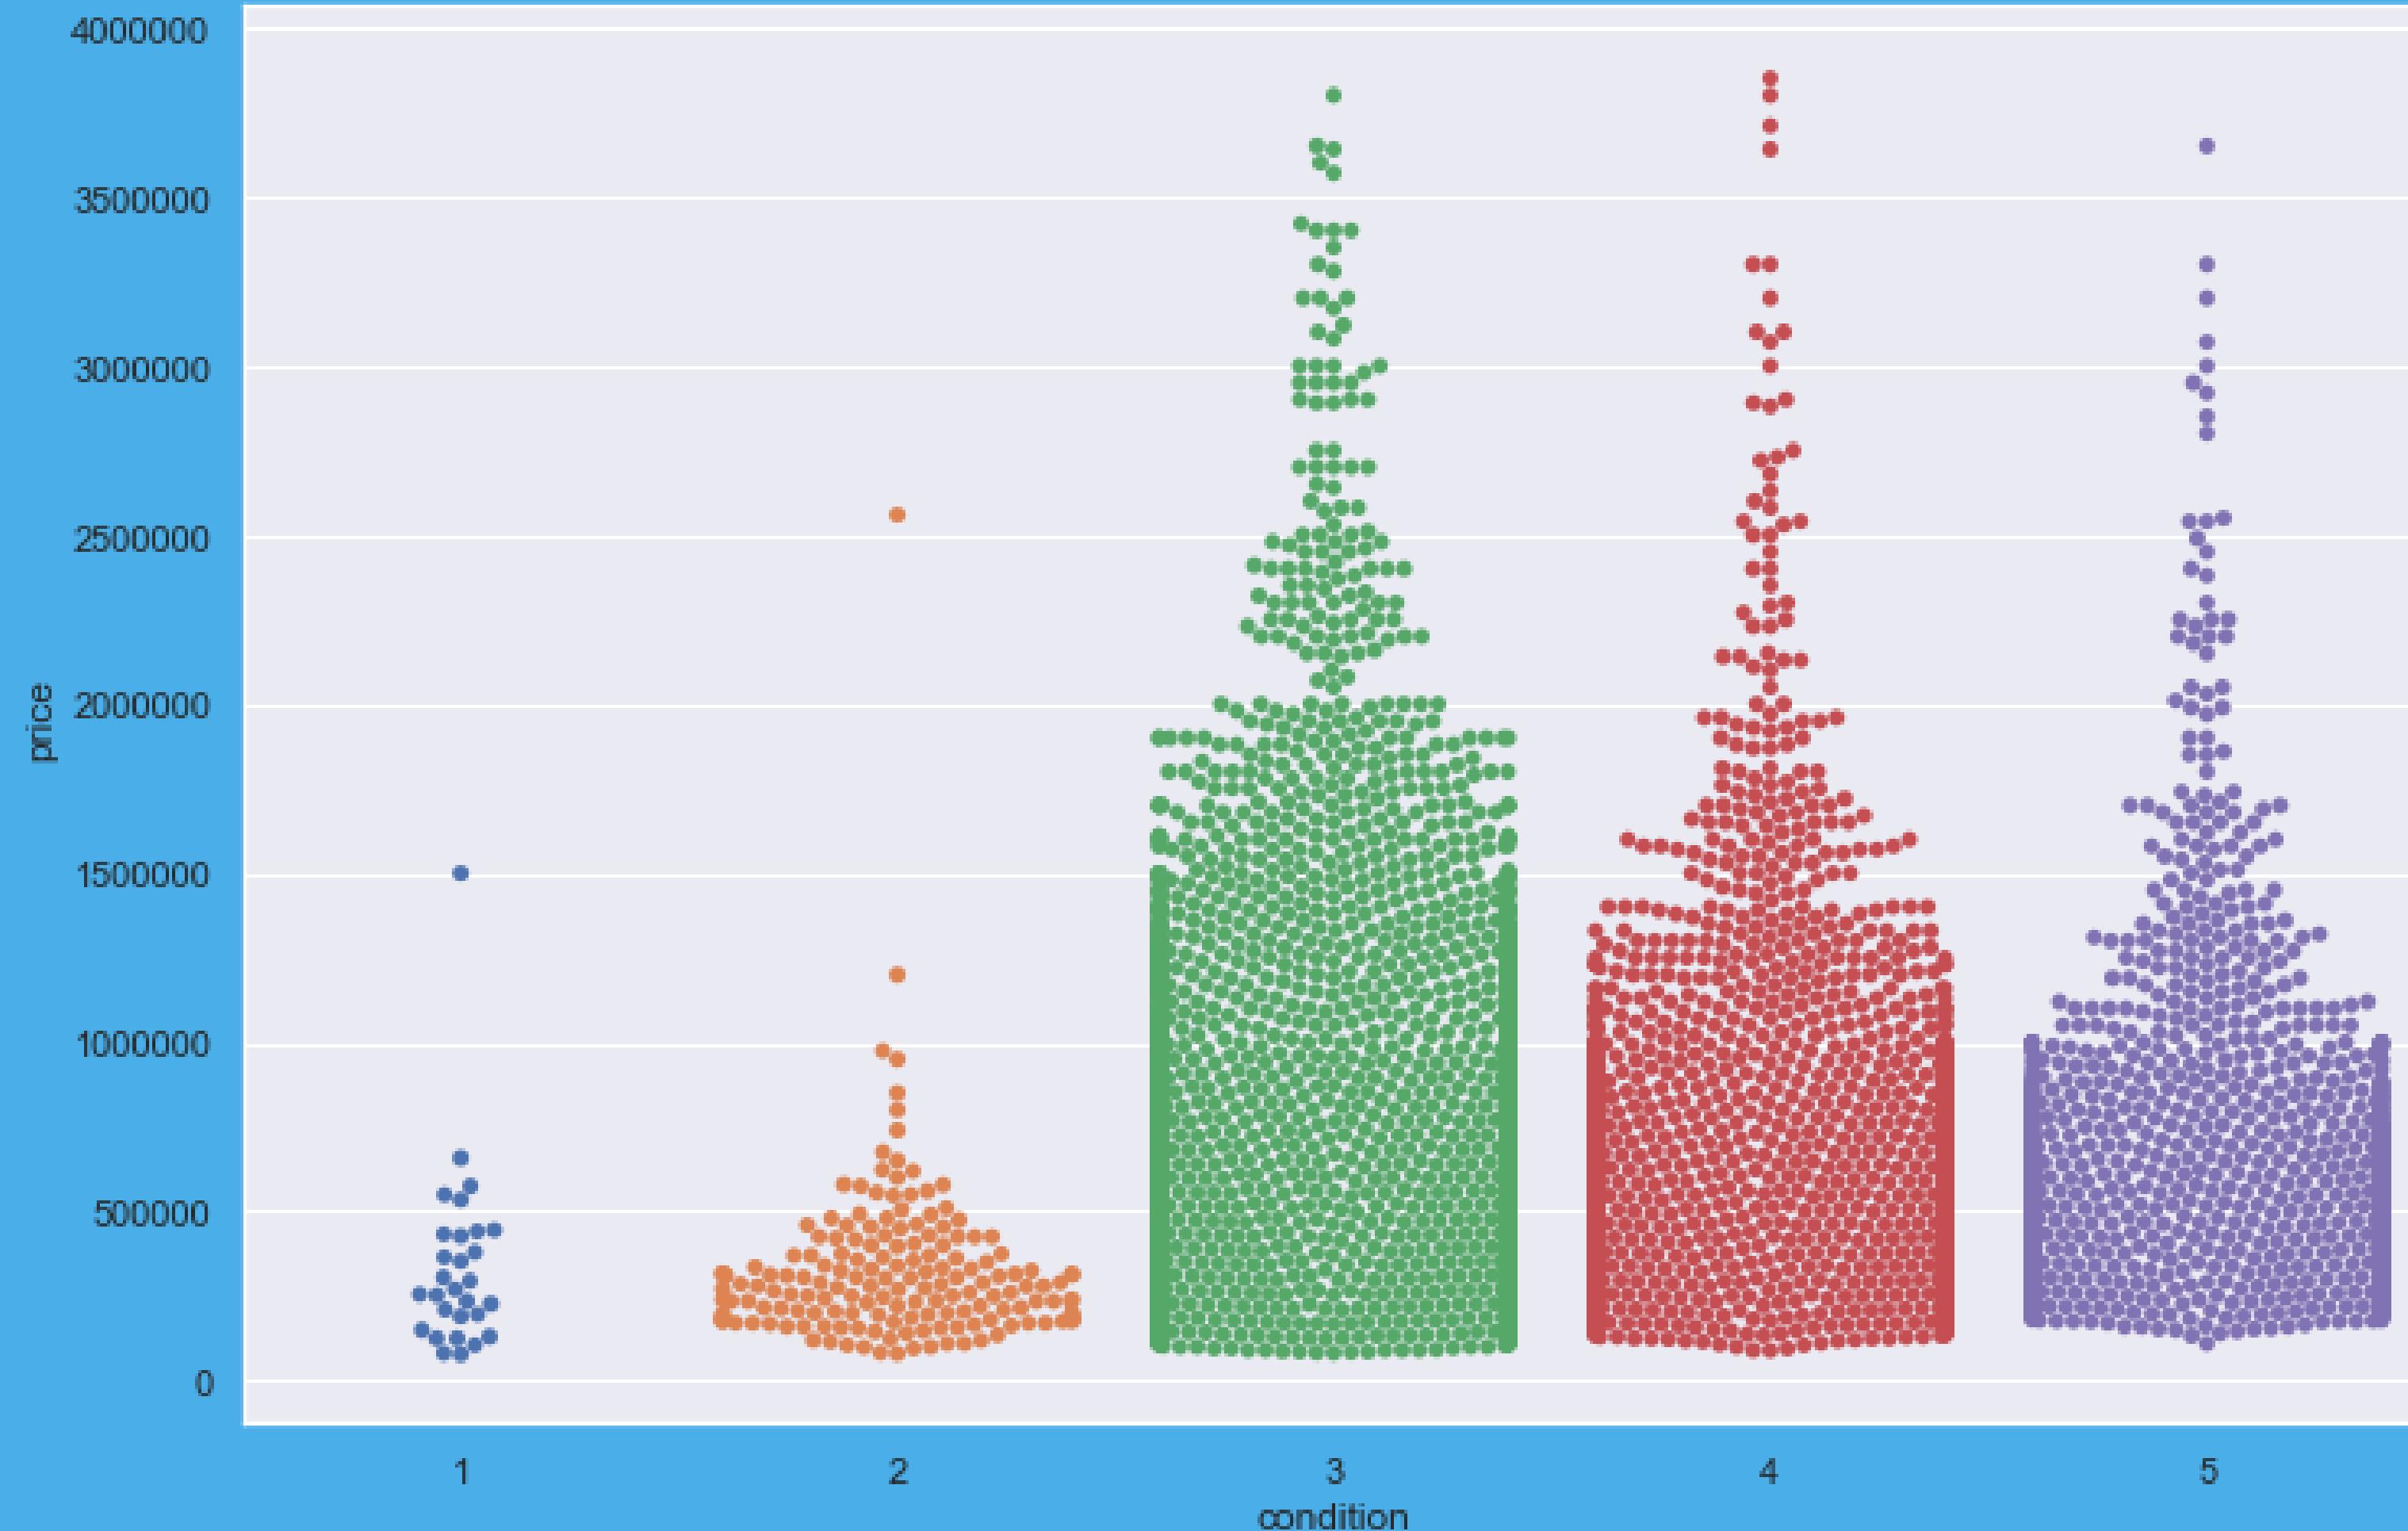

- i) Making small updates can increase the price and the possibility of selling your house.
- ii) Sell your house at the right month.

The Distribution of Houses Sold Every Month

Condition vs Price graph of houses sold

Recommendations

3) For real estate agents;

Giving the right price to a house decreases the DOM(days on the market) and makes you work efficiently. My model is 89% predictive. I need more information about houses to make the model efficient.

FUTURE WORK

MAKE THE MODEL MORE EFFICIENT

Future Work

Zip code

I didn't use zip code information. I used zip code as a proxy in my model. I had only 70 different zip codes. I could make one hot encoding to these 70 columns. If this model is enlarged, there are going to be thousands of zip codes. We need to use the information included in the zip codes instead of making categorical columns. Zip code contains detailed information about income, house values, rental houses, demographics, education level of the residents, school grades and location. More information can be obtained from the zip code and can be used in the predictions.

Future Work

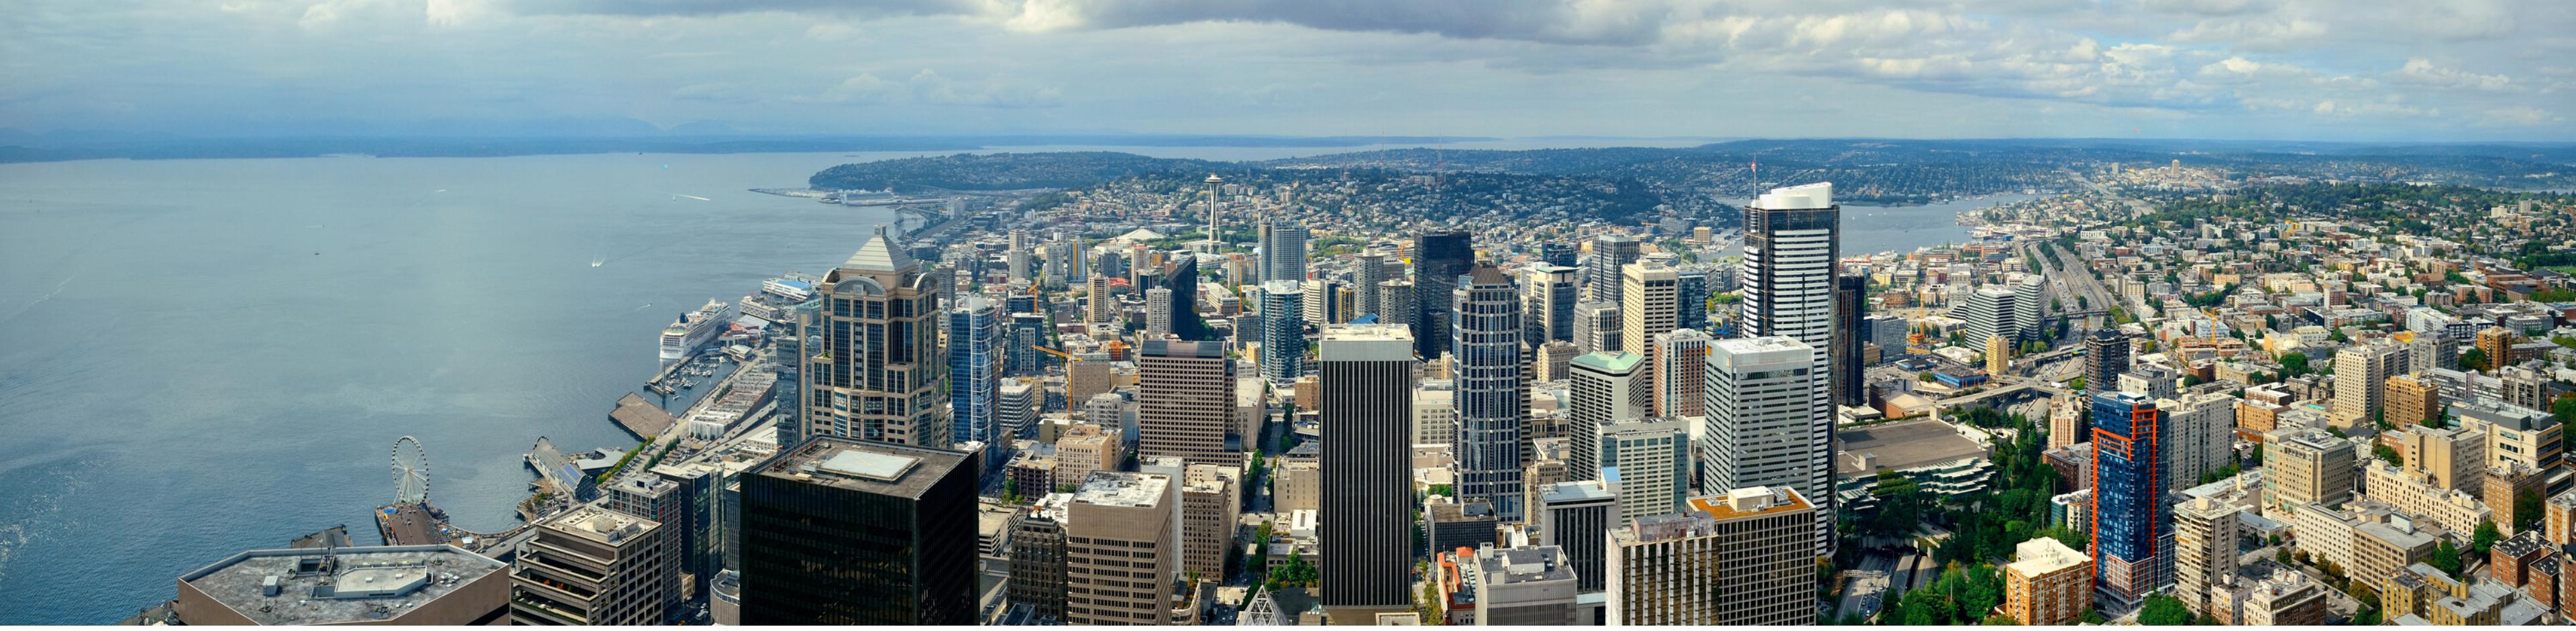

More detailed dataset

I have 20 factors to predict the value of houses. I need approximately 100 predictors to make the house price algorithm work more properly. If I had (at least)garage, garden and pool information I would make more efficient predictions.

Questions and comments

Thank you!
